# On the Subject of Connected Quizbowl

Welp, I will no longer get pinged for right answers causing strikes!

All tossups and answers are, for the most part, in English. Sorry.

If the button does not have a WiFi signal, you are looking at a different module.

This module requires access to the internet. If the module cannot connect to the internet, then the module will default to a set list of tossups.

This module consists of a screen which displays a clue for a tossup, a red button for submitting an answer, and a square button for going to the next clue.

To activate this module, press the "Activate" button when it appears.

A clue is a part of a tossup that ends with a period.

You can buzz in at any time, then you can type your answer.

Typable keys include all letter keys, number keys above the letter keys, the spacebar, the apostrophe, the period, and the hyphen.

Press the backspace key on your keyboard to backspace.

Press the enter key closest to the letters on your keyboard to submit the answer.

Answers can be prompted or anti-prompted, meaning you can get another chance at getting the correct answer.

Entering an incorrect answer will cause a strike.

Entering a correct answer will solve the module.

If you get an answer wrong at the last hint, a hint that says "For 10 Points", a new tossup will be generated, requiring you to reactivate the module.
