## On the Subject of X-Rays

I can see right through you.

- Three symbols are revealed in the window by an x-ray scanner, which shows a thin section of each symbol at a time. If there are not exactly three symbols, you are looking at a different module.
- The scan progresses in one of three ways: from top to bottom, from bottom to top, or alternating back and forth.
- Two of the three symbols identify a row and a column in the big table below. Find the intersection of the relevant row and column.
- Stay there or move to an adjacent cell as indicated by the third symbol's location in the small table above. The center of the table corresponds to your current location. Push the button with the number you moved to.
