

On the Subject of Turtle Robot

It's a bit old and buggy, but it works.

An old terminal computer contains drawing instructions for a [Turtle robot](#). For example:

- **FD 4** — Move 4 steps forward.
- **LT 90** — Rotate 90 degrees left.
- **RT 90 2** — Move in a curve, making 90 degrees of a circle with radius 2.

Following the instructions you'll get one of the drawings below. It can be rotated, mirrored and/or scaled. The code contains three bugs in the form of extraneous inserted instructions. Use the arrow keys to scroll through the source code. Comment out the bugs using the '#' key. Commenting out a command that isn't a bug results in a strike. Mark all bugs to solve the module.
